With the explosion of knowledge taking place in recent decades, scientists are constantly discovering that things they have been certain about are wrong: the continents they thought had been in place forever actually drift around; the cells we are made of are not simple but infinitely complex; our genus has been on Earth many times longer than they thought. And increasingly there is compelling evidence that scientists are wrong about our living relatives. One thing considered certain was that the giants and wild men in stories from all over the world are entirely imaginary. Now that belief is under serious challenge. Forty-five years ago giant footprints found in northern California brought Bigfoot to the attention of many revived interest in Canada's Sasquatch. Every year since then additional evidence has accumulated, and now that witnesses can submit information via the internet the trickle of reports has become a flood. John Green has been in the thick of things from the beginning. In 'Sasquatch, The Apes Among Us', first published in 1978, he sampled the evidence from the earliest records up to the late 1970s and from all around the world, then concentrated on two aspects of the subject: the nature of the animal described and the wealth of reports from parts of North America outside the Pacific Northwest. When it came out 'The Apes Among Us' was acclaimed as the definitive work on the fascinating subject of whether humans share North America with a giant bipedal primate that is unknown to science. Since then evidence for the existence of that unknown primate has grown exponentially, and individual scientists have written books about aspects of it. Remarkably, however, to most of the scientific world the evidence remains unknown and unexplored, and for those who do follow the subject this is still the definitive book.
